Report on teaching sessions carried out on the relevance and operational features of the immunization clinic

Immunization activities are carried out for students through the provision of immunization services within designated clinics, in adherence to national guidelines.

The curriculum provides comprehensive coverage of immunization through a combination of didactic lectures and practical hands-on instructional modules. Lectures pertaining to Immunization are delivered as part of the curriculum in the second, third, and final years of the (MBBS) program.

The lectures encompass a range of subjects including the National Immunization Schedule, the suitable age for pertinent immunizations, the recommended site, dosage, and route of administration for vaccines, as well as the potential adverse effects that may arise subsequent to immunization.

Cohorts of medical students in their second and third years are assigned to a neighboring government health facility, where they are provided with a thorough exposition on the cold chain concept.

The Department of Pediatrics and Community Medicine encompasses a range of subjects pertaining to the National Immunization schedule, Principles of Immunization, AFP surveillance, pulse polio program, vaccines and vaccine preventable diseases, adverse effects following vaccination, and advancements in newer vaccines.

In the Pediatric departments, students will get a chance to engage in observational experiences encompassing a range of activities. These activities include assessing the expiry date of vaccines, monitoring the Vaccine Vial Monitor, extracting vaccines from vials, preparing the requisite components, comprehending the route of administration, ascertaining the appropriate needle position, and delivering instructions to parents subsequent to vaccination.
